Cubing systems

The fibo cubing systems are highly effective and reliable solutions for handling blocks, paving stones and similar products.
The cuber frame is a sturdy steel construction which offers the highest stability.
The products are handled in a careful way with soft starts and stops where the transverse movement of the cuber is controlled by servo controlled motor.

fibo cubing systems are controlled by PLC technology and can optionally be supplied with PC for communication and monitoring.

Complete packing line with cuber.

Cuber combined with pallet turner.

The cubing head is designed according to task.
Photo showing special head for handling more block layers.

fibo intercon offers a wide range of machines and equipment for the block industry

- *Elevators/lowerators*
